Appeal to society

In nature, complex physical processes take place that affect people's consciousness and manifestation of various processes (events) in nature and society. These processes can be described by mathematical algorithms. In this way, many complex and even dramatic processes can be predicted and made controllable.

There has been a long period of a new QUALITY in nature. Almost all quantitative processes in nature and society will now take on a new quality. These processes can also be described mathematically and made controllable.

Such calculations, forecasts and explanations, computer programs and other "notes" can be created and used in everyday life for any private person, for commercial companies, for official structures, for scientific organizations.

The accuracy of such calculations is up to 98 percent. It is possible to create calculations for several years, for selected year, month, week and day. And also for the selected hour in each day.

There is a lot of educational and other insightful literature. There are distance and face-to-face courses of the training courses. There are training programs. There are methods to "accompany" complex and confusing situations with the aim of forming the controllability of such situations.

In Germany we are building an international center (holding) for research into natural biorhythms.

Calculations and forecasts are made on the basis of natural biorhythms. But all algorithms have a clear mathematical style and format.

You can express your opinion on these topics on our website forum. In official world science, such studies have not been found. We are creating a new scientific direction in world science.
